

LOHA

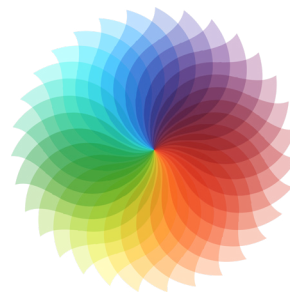

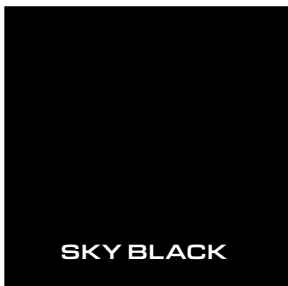

PERFORATED METAL

LOHA perforated metal panels offer a remarkable combination of aesthetics and functionality. The LOHA finish is a perforated metal that can be die-sublimated to mimic the appearance of wood, providing a warm and natural look without sacrificing durability and strength. Our range of perforated pattern options is extensive, from the alignment of open areas to the type of end finish, we offer a multitude of choices. This includes popular round patterns in different alignments, such as staggered or straight, each creating a unique aesthetic and functional quality.

KEY FACTORS:

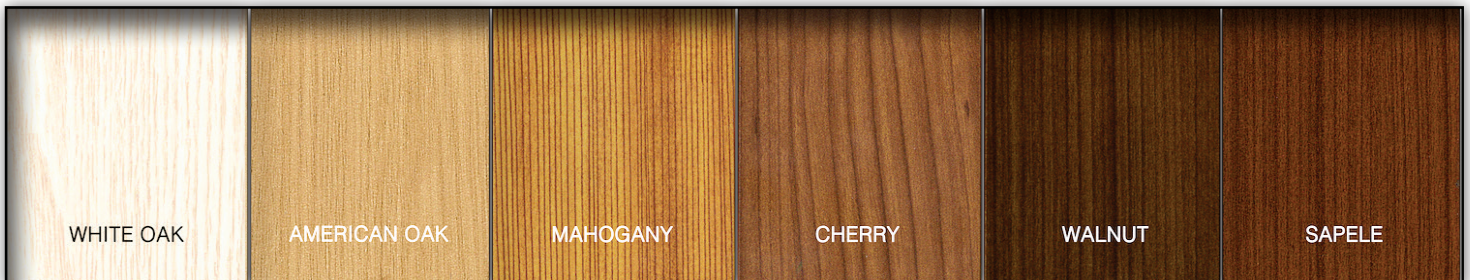

- DURABILITY:** What is the impact resistance required ?
- COLOR:** Color matching can take time and should be considered early in the design process.
- ACOUSTICAL PERFORMANCE :** The open area of the perforation pattern will dictate how much sound waves are absorbed and thus will impact the overall acoustic performance.
- BORDERING:** Does the design require perforation to fall off the edge? or does the perforated design need to be bordered.
